Forest Statistics for Virginia, 1992

Tony G. Johnson

The Forest Service, U.S. Department of Agriculture, is dedicated to the principle of multiple use management of the Nation's forest resources for sustained yields of wood, water, forage, wildlife, and recreation. Through forestry research, cooperation with the States and private forest owners, and management of the National Forests and National Grasslands, it strives-as directed by Congress-to provide increasingly greater service to a growing Nation.

USDA policy prohibits discrimination because of race, color, national origin, sex, age, religion, or handicapping condition. Any person who believes he or she has been discriminated against in any USDA-related activity should immediately contact the Secretary of Agriculture, Washington, DC 20250.

Forest Statistics for Virginia, 1992

Tony G. Johnson, Forester
Forest Inventory and Analysis
Asheville, North Carolina

Foreword

This report highlights the principal findings of the sixth forest survey of Virginia. Field work began in October 1990 and was completed in January 1992. Five previous surveys, completed in 1940, 1957, 1966, 1977, and 1986, provide statistics for measuring changes and trends over the past 52 years. The primary emphasis in this report is on the changes and trends since 1986. Previously reported figures have been adjusted to provide the best estimate of change.

Periodic surveys of forest resources are authorized by the Forest and Rangeland Renewable Resources Research Act of 1978. These surveys are a continuing, nationwide undertaking by the Regional Experiment Stations of the USDA Forest Service. In Florida, Georgia, North Carolina, South Carolina, and Virginia, these surveys are administered by the Forest Inventory and Analysis (Forest Survey) Research Unit at the Southeastern Forest Experiment Station, with headquarters in Asheville, NC. The primary objective of the survey is to periodically inventory and evaluate all forest and related resources. These multiresource data help provide a basis for formulating forest policies and programs and for the orderly development

and use of the resources. This report deals only with the extent and condition of forest land, associated timber volumes, and rates of timber growth and removals.

Reports have been issued for the Coastal Plain, Southern Piedmont, Northern Piedmont, and the Northern Mountain survey units in Virginia as USDA Forest Service Resource Bulletins SE-122, SE-124, SE-127, and SE-128. A similar report for the Southern Mountains of Virginia, SE-130 is being released with this report. An indepth analytical report for the State should be available in late 1993.

The Southeastern Station gratefully acknowledges the cooperation and assistance provided by the Virginia Division of Forestry in collecting field data. Appreciation is also expressed for the excellent cooperation of other public agencies, forest industry, and other private landowners in providing information and access to the sample locations.

A handwritten signature in black ink, reading "Noel D. Cost". The signature is written in a cursive, flowing style with a large initial 'N'.

*Tables 1-12, 27, 29-33, 35-38, 41, 42, and 44 are common to all Forest Inventory and Analysis forest resource statistical reports of the Eastern United States.

Trends in timberland area since 1986, as shown in this report, reflect a 0.9-percent upward adjustment in the acreage of timberland for 1986. The adjustments were confined to the Northern Piedmont and Mountain Survey Units. Revisions were necessary due to the incomplete and poor-quality aerial photography available for the 1986 survey and to the associated difficulties in photo interpretation of land use. For those desiring more information about these changes, please contact the FIA staff at:

Since the fifth inventory of Virginia's forest resources was completed in 1986--

• area of timberland declined by about 122,000 acres, or less than 1 Percent. Timberland currently occupies 15.4 million acres, or 61 percent of the total land area in the State of Virginia. Land use changes occurred on more than 610,000 acres of land. More than 366,000 acres of timberland were diverted to other land uses, while 244,000 acres were added to the timberland base. Tree planting and natural seeding on former agricultural land accounted for 92 percent of the additions; the remainder came from the reclassification of woodland and reserved forest land to timberland status. Timberland clearing for urban development accounted for 61 percent of the diversions, with clearing for agriculture accounting for 20 percent, and water for 1 percent. Almost 66,000 acres, or 18 percent, were reclassified as reserved timberland. Reductions in timberland were recorded in four of the five Survey Units, but more than half of the net loss occurred in the Coastal Plain.

. area of timberland owned by nonindustrial private forest (NIPF) landowners increased nearly 2 Percent and currently totals 11.9 million acres. This ownership group controls 77 percent of the timberland in Virginia. Within the NIPF category, farmer-owned timberland declined 8 percent to 3.9 million acres. In contrast to farm timberland, that held by individuals who do not farm increased 4 percent to 6.5 million acres, and timberland held by corporations that do not manufacture forest products increased 20 percent to 1.5 million acres. Timberland owned or leased by forest industry dropped 16 percent to 1.6 million acres. Altogether, forest industry controls 10 percent of the timberland in Virginia, with holdings concentrated in the Coastal Plain and Southern Piedmont regions. Area of timberland in public ownership remained stable at 2.0 million acres and constitutes 13 percent of the timberland base. Nearly three-fourths of the publicly owned timberland is in the George Washington and Jefferson National Forests, which are contained primarily in the Northern and Southern Mountain Units of Virginia.

. area of timberland classified as a pine type declined less than 1 percent and now totals 3.4 million acres. Acreage in planted pine stands jumped more than 25 percent from 1.2 to 1.5 million acres and accounts for nearly 44 percent of all the pine stands in Virginia. Natural pine stands declined nearly 15 percent to 1.9 million acres. Acreage in loblolly pine forest type--the dominant pine type in the State--increased 12 percent to 2.0 million acres. In contrast, Virginia, shortleaf, pond, and pitch pine forest types all declined in acreage. Area of oak-pine forest types increased 14 percent to 1.9 million acres. With 10.2 million acres, hardwood forest types account for two-thirds of the timberland in Virginia. Within the hardwood types, oak-hickory forest type dropped 409,000 acres, or by 4 percent.

However, with 9.4 million acres, oak-hickory forest type accounts for 92 percent of the hardwood acreage and is the single largest forest type in the State.

. more than 186,000 acres were harvested annually and retained in timberland. This average represents only a 1-percent increase over that harvested between 1977 and 1986. Of the acres harvested, 73 percent were on NIPF land, 21 percent on land controlled by forest industry, and the remaining 6 percent on public land. Hardwood stands accounted for 53 percent of the total annual harvest. Pine stands made up 34 percent and oak-pine stands made up the remaining 13 percent of the annually harvested acreage. In addition to final harvests, some form of partial harvest or intermediate cutting occurred on 66,000 acres annually. Natural disturbances such as insects, diseases, weather, and fire damaged 196,000 acres annually. This average represents a 34-percent increase over that measured during the previous remeasurement cycle.

. artificial and natural regeneration increased 16 percent from an average of 173,000" to 201,000 acres annually. Natural regeneration accounted for 61 percent of the new stands, or about 123,500 acres per year. About 73 percent of the total regeneration occurred on NIPF land, 22 percent on forest industry land, and the remaining 5 percent on public land. Thirty-four percent of the regenerated stands resulted in pine forest types, 23 percent in oak-pine, and 43 percent in hardwood types. Pine and oak-pine stands were established on more than 115,000 acres annually; the establishment rate for pine and oak-pine stands exceeded the harvest rate by 31 percent. Artificially regenerated acreage was up 5 percent to 78,000 acres yearly, accounting for 39 percent of the area regenerated. Artificial regeneration on NIPF land increased 21 percent to 44,000 acres annually. On forest industry land the rate of planting

declined 6 percent to 33,000 acres annually. Currently, planted pine stands occupy 43 percent of all forest industry timberland in the State, as compared with 6 percent of NIPF land, and 2 percent of public land.

•average basal area of live trees 5.0 inches d.b.h. and larger increased 3 percent from 78 to 80 square feet Per acre. Merchantable net volume per acre of softwoods and hardwoods combined currently averages 1,850 cubic feet per acre and includes nearly 5,200 board feet of sawtimber. Stands dominated by sawtimber-size trees increased nearly 3 percent to 7.6 million acres, or roughly half of the State's total timberland area. Acreage in stands classed as fully stocked increased nearly 8 percent to 6.2 million acres, while acreage in medium-stocked stands declined by 5 percent to 6.9 million acres. Together, fully stocked and medium-stocked stands account for 85 percent of the total timberland area. Acreage in poorly stocked stands dropped 7 percent, and now accounts for 15 percent of the timberland area.

•volume of softwood growing stock increased 6 percent from 6.3 to 6.6 billion cubic feet. Softwood volume increased across all ownership categories. However, 89 percent of the softwood volume increase occurred on NIPF land, where softwood volume was up 8 percent to 4.8 billion cubic feet. Volume of softwood growing stock on forest industry land remained stable at 1.1 billion cubic feet, and was up by 5 percent to 0.7 billion cubic feet on public land. Volume of loblolly pine--the predominant softwood species in the State--increased nearly 18 percent to 3.0 billion cubic feet, or 45 percent of the softwood inventory. This species alone accounted for 82 percent of the increase in softwood growing-stock volume. Volume of eastern white pine, an important species in the mountain region, increased 13 percent to 0.7 billion cubic feet. The

largest declines in softwood inventory occurred in Virginia and shortleaf pines. Their volumes fell 5 and 12 percent, respectively, to 1.8 and 0.5 billion cubic feet. Volume of softwood growing stock increased across all diameter classes. Collectively, the 8-, 10-, and 12-inch diameter classes increased nearly 7 percent and make up 57 percent of the total softwood volume. Volume in trees 15.0 inches d.b.h. and larger increased more than 10 percent to 1.2 billion cubic feet. Pine plantations contain 22 percent of the softwood growing-stock inventory. Volume of softwood sawtimber increased nearly 8 percent from 18.4 to 19.9 billion board feet.

● volume of hardwood growing stock increased 6 percent from 18.7 to 19.8 billion cubic feet. Hardwood volume on NIPF land increased 6 percent to 15.6 billion cubic feet. This ownership category accounts for 79 percent of the State's hardwood inventory. Hardwood volume on publicly owned timberland was up 14 percent to 3.2 billion cubic feet. In contrast, hardwood volume declined by 13 percent on forest industry land to 1.0 billion cubic feet. Most of the major hardwood species registered significant gains in the State. The inventory of yellow-poplar, the most abundant single hardwood species, increased 11 percent to 3.5 billion cubic feet. This species accounted for 28 percent of the increase in hardwood volume. Collectively, the inventory of oak species increased 4 percent to 9.6 billion cubic feet; oaks account for almost half the hardwood volume. Volume of sweetgum and the maples increased 2 and 15 percent to 0.9 and 1.8 billion cubic feet, respectively. Hardwood growing-stock volume increased in all but the 6- and 8-inch diameter classes. Volume in each of these diameter classes dropped 2 percent. Volume in trees 15.0 inches d.b.h. and larger was up nearly 14 percent to

7.9 billion cubic feet. These size classes account for 40 percent of the hardwood growing-stock volume. Volume of hardwood sawtimber increased 11 percent to 60.4 billion board feet,

. net annual growth of softwood growing stock increased nearly 39 percent from 229 to 317 million cubic feet. Softwood net growth was up significantly for all ownership categories--by 43 percent on NIPF land, 32 percent on forest industry land, and 21 percent on public land. Across all ownerships, softwood net growth exceeded removals by 25 percent. More than two-thirds of the surplus growth occurred on NIPF land, where growth exceeded removals by 27 percent. In contrast to softwood growth, net annual growth of hardwood growing stock declined 7 percent from 573 to 531 million cubic feet. This decline in hardwood growth was recorded across all ownership categories. Despite the decline, hardwood growth exceeded removals by 53 percent. In comparison, during the last remeasurement cycle, hardwood growth was more than double removals. Net annual growth for all species included 3.3 billion board feet of sawtimber, up 5 percent since 1985. Net growth per acre for softwood and hardwood growing stock increased from 51 to 55 cubic feet per acre per year.

● annual removals of softwood growing stock increased almost 23 percent from 206 to 253 million cubic feet. Sixty-six percent of the softwood removals came from NIPF land, 28 percent from forest industry land, and the remaining 6 percent from public timberland. Softwood removals increased across all ownership categories. On NIPF land, softwood removals rose 20 percent to 168 million cubic feet. Softwood removals on forest industry land were up 16 percent to 70 million cubic feet, and more than doubled on public land to 16 million cubic

feet. Softwoods accounted for 42 percent of all growing-stock removals and included 843 million board feet of sawtimber. Hardwood growing-stock removals were up 27 percent from 274 to 346 million cubic feet annually. On NIPF timberland, hardwood removals increased 36 percent to 287 million cubic feet and accounted for 83 percent of the total hardwood removals. Hardwood removals were up 41 percent on public land, but fell nearly 18 percent on forest industry land. Hardwood removals included 1.2 billion board feet of sawtimber, up 26 percent since 1985.

. annual mortality of softwood growing stock dropped 24 percent from 72 to 55 million cubic feet. Softwood mortality was down 17 percent on NIPF land, 24 percent on public land, and .54 percent on forest industry land. Eighty-one percent of the softwood mortality occurred on NIPF timberland. Softwood mortality reduced gross growth by 15 percent and included 132 million board feet of sawtimber. Annual' mortality of hardwood growing stock increased nearly 33 percent from 91 to 121 million cubic feet. Hardwood mortality was up 42 percent on NIPF land and 31 percent on public land, but it was down 37 percent on forest industry land. More than three-fourths of the hardwood mortality occurred on NIPF timberland. Hardwood mortality reduced gross growth by 19 percent and included 324 million board feet of sawtimber.

How the Inventory is Made

The method of the inventory is a sampling procedure designed to provide reliable statistics primarily at the State and Survey Unit levels. Individual county statistics are presented so that any combination of counties may be added together until a total is large enough to meet the desired degree of reliability. Procedures were as follows:

1. Initial estimates of forest and nonforest areas were based on the classification of 78,669 sample clusters systematically spaced on the latest aerial photographs available. A subsample of 7,007 of the 16-point clusters was ground checked, and a linear regression was fitted to the data to develop the relationship between the photo and ground classification of the subsample. This procedure provides a means for adjusting the initial estimates of area for change in land use since date of photography and for photo misclassification.

2. Estimates of timber volume and forest classification were based on measurements recorded at 4,235 ground sample locations systematically distributed on timberland. The plot design at each location was based on a cluster of 10 points. In most cases, variable plots, established by using a basal-area factor of 37.5 square feet per acre, were systematically spaced within a single forest condition at 5 of the 10 cluster points. Trees less than 5 inches d.b.h. were tallied on a fixed-radius plot around each point center.

3. Equations prepared from detailed measurements collected on standing trees in this Survey Unit, and similar measurements taken throughout the Southeast, were used to compute the volume of individual tally trees. A mirror caliper and sectional aluminum poles were used to obtain the additional measurements required to construct volume equations.

4. Felled trees were measured at 104 active cutting operations. These data will supplement the standing-tree volume data and be used to generate utilization factors for product and species groups. Forest biomass estimates were made from equations developed by the Utilization of Southern Timber Research Work Unit of the Southeastern Forest Experiment Station in Athens, GA.

5. Estimates of growth, removals, and mortality were determined from the remeasurement of 4,324 permanent sample plots established in the fifth survey.

6. Ownership information was collected from correspondence, public records, and local contacts. In counties where the sample missed a particular ownership class, temporary sample plots were added.

7. All field data were sent to Asheville for editing and were entered into disk and magnetic-tape storage for processing. Final estimates were based on statistical summaries of the data.

Reliability of the Data

Statistical analysis of these data indicates the following sampling errors in terms of one standard error (two times out of three):

	<u>Percent</u>
Per million acres of	
timberland	0.93
Per billion cubic feet of	
growing stock.	5.72
Per billion cubic feet of	
net annual growth.	1.11
Per billion cubic feet of	
annual removals.	3.58

*Sampling error of breakdowns of county and unit totals may be computed with the following formula:

$$E = \frac{(SE) \sqrt{(\text{Specified volume or area})}}{\sqrt{(\text{Volume or area total in question})}}$$

Where: E = Sampling error of the volume or area total in question

SE = Specified sampling error in table.

^bBy random-sampling formula (in percent).

Definitions of Terms

Allowable cut. The volume of timber that could be cut on timberland during a given period under specified management plans aimed at sustained production of timber products.

Basal area. The area in square feet of the cross section at breast height of a single tree or of all the trees in a stand, usually expressed as square feet of basal area per acre.

Biomass. The aboveground green weight of solid wood and bark in live trees 1.0 inch d.b.h. and larger from the ground to the tip of the tree. All foliage is excluded. The weight of wood and bark in lateral limbs, secondary limbs, and twigs under 0.5 inch in diameter at the point of occurrence on sapling-size trees is included but is excluded on poletimber and sawtimber-size trees.

Bole. That portion of a tree between a 1-foot stump and a 4-inch top diameter outside bark (d.o.b.) in trees 5.0 inches d.b.h. and larger.

Broad management class. A classification of timberland based on forest type and stand origin.

Pine plantation. Stands that have been artificially regenerated by planting or direct seeding and with a southern yellow pine, white pine-hemlock, or other softwood forest type.

Natural pine. Stands that have not been artificially regenerated and with a southern yellow pine, white pine-hemlock, or other softwood forest type.

Oak-pine. Stands with a forest type of oak-pine.

Upland hardwood. Stands with a forest type of oak-hickory, chestnut oak, southern scrub oak, or maple-beech-birch.

Lowland hardwood. Stands with a forest type of oak-gum-cypress, elm-ash-cottonwood, palm, or other tropical.

Bureau of Land Management lands. Federal lands administered by the Bureau of Land Management.

Census water. Streams, sloughs, estuaries, canals, and other moving bodies of water one-eighth of a statute mile in width and greater, and lakes, reservoirs, ponds, and other permanent bodies of water 40 acres in area and greater.

Commercial forest land. (see: Timberland).

Commercial species. Tree species conventionally regarded as being able to develop into trees suitable for the manufacture of industrial timber products. Species that typically exhibit small size, poor form, or inferior quality are excluded.

Cropland. Land under cultivation within the past 24 months, including orchards and land in soil-improving crops but excluding land cultivated in developing improved pasture. Also includes idle farmland.

D.b.h. Tree diameter (outside bark) at breast height (4.5 feet above the ground).

Diameter class. A classification of trees based on tree d.b.h. Two-inch diameter classes are commonly used by Forest Inventory and Analysis, with the even inch as the approximate midpoint for a class. For example, the 6-inch class includes trees 5.0 through 6.9 inches d.b.h.

Farm. Land on which agricultural operations are being conducted and sale of agricultural products totaled \$1,000 or more during the year.

Farm operator. A person who operates a farm, either doing the work or directly supervising the work.

Farmer-owned land. (see: Other private land) .

Forest industry land. Land owned by companies or individuals operating wood-using plants.

Forest industry-leased land. Land leased or under management contracts to forest industry from other owners for periods of one forest rotation or longer. Land under cutting contracts is not included.

Forest land. Land at least 16.7 percent stocked by forest trees of any size, or formerly having had such tree cover, and not currently developed for nonforest use.

Forest type. A classification of forest land based on the species forming a plurality of live-tree stocking.

White pine-hemlock. Forests in which eastern white pine, red pine, or jack pine, singly or in combination, constitute a plurality of the stocking. (Common associates include hemlock, birch, and maple.)

Spruce-fir. Forests in which spruce or true firs, singly or in combination, constitute a plurality of the stocking. (Common associates include maple, birch, and hemlock.)

Longleaf-slash pine. Forests in which longleaf or slash pine, singly or in combination, constitute a plurality of the stocking. (Common associates include oak, hickory, and gum.)

Loblolly-shortleaf pine. Forests in which loblolly pine, shortleaf pine, or other southern yellow pines, except longleaf or slash pine, singly or in combination, constitute a plurality of the stocking. (Common associates include oak, hickory, and gum.)

Oak-pine. Forests in which hardwoods (usually upland oaks) constitute a plurality of the stocking but in which pines account for 25 to 50 percent of the stocking. (Common associates include gum, hickory, and yellow-poplar.)

Oak-hickory. Forests in which upland oaks or hickory, singly or in combination, constitute a plurality of the stocking, except where pines account for 25 to 50 percent, in which case the stand would be classified oak-pine. (Common associates include yellow-poplar, elm, maple, and black walnut.)

Oak-gum-cypress. Bottom-land forests in which tupelo, blackgum, sweetgum, oaks, or southern cypress, singly or in combination, constitute a plurality of the stocking, except where pines account for 25 to 50 percent, in which case the stand would be classified oak-pine. (Common associates include cottonwood, willow, ash, elm, hackberry, and maple.)

Elm-ash-cottonwood. Forests in which elm, ash, or cottonwood, singly or in combination, constitute a plurality of the stocking. (Common associates include willow, sycamore, beech, and maple.)

Maple-beech-birch. Forests in which maple, beech, or yellow birch, singly or in combination, constitute a plurality of the stocking. (Common associates include hemlock, elm, basswood, and white pine.)

Palm, other tropicals. Forests in which palms and other tropicals constitute a plurality of the stocking,

Gross growth. Annual increase in merchantable volume of trees in the absence of cutting and mortality. (Gross growth includes survivor growth, ingrowth,

growth on ingrowth, growth on removals prior to removal, and growth on mortality prior to death.)

Growing-stock trees. Live sawtimber-size trees of commercial species containing at least a 12-foot log, or two noncontiguous saw logs each 8 feet or longer, meeting minimum grade requirements (hardwoods must qualify as a log grade of either 3 or 4; softwoods must qualify as a log grade 3) with at least one-third of the gross board-foot volume (International 1/4-inch rule) between a 1-foot stump and the minimum saw-log top being sound, or a live tree below sawtimber size that will prospectively qualify under the above standards.

Desirable tree. A tree that qualifies as growing stock and has no serious defects in quality limiting present or prospective use; is of relatively high vigor (30 percent or more live crown ratio); is compatible with the site and physiographic class; has a total board-foot loss not to exceed 15 percent in softwoods or 25 percent in hardwoods as a result of severe sweep, crook, or lean; and has a relatively clear bole.

Acceptable tree. A tree that qualifies as growing stock but does not meet the minimum requirements to qualify as a desirable tree. Included are sawtimber-size trees that do not contain a 12-foot saw log because of excessive, natural taper in the butt log but have the potential to produce a 12-foot saw log as diameter increases.

Growing-stock volume. Volume (cubic feet) of solid wood in growing-stock trees 5.0 inches d.b.h. and larger, from a 1-foot stump to a minimum 4.0-inch top diameter, outside bark, on the central stem. Volume of solid wood in primary forks from the point of occurrence to a minimum 4.0-inch top diameter outside bark is included.

Hardwoods. Angiosperms; dicotyledonous trees (including all palm species which are monocotyledonous), usually broadleaf and deciduous.

Soft hardwoods. Soft-textured hardwoods such as boxelder, red and silver maples, hackberry, loblolly-bay, sweetgum, yellow-poplar, magnolia, sweetbay, water tupelo, blackgum, sycamore, cottonwood, black cherry, willow, basswood, and elm.

Hard hardwoods. Hard-textured hardwoods such as sugar maple, birch, hickory, dogwood, persimmon (forest grown), black locust, beech, ash, honeylocust, holly, black walnut, mulberry, and all commercial oaks.

Idle farmland. Land including former cropland, orchard, improved pasture, and farm sites not tended within the past 2 years, and currently less than 16.7 percent stocked with live trees.

Improved pasture. Land currently improved for grazing by cultivation, seeding, irrigation, or clearing of trees or brush.

Indian land. All lands held in trust by the United States for individual Indians or tribes, or all lands, titles to which are held by individual Indians or tribes, subject to Federal restrictions against alienation.

Industrial wood. All roundwood products except fuelwood.

Ingrowth. The number or net volume of trees that grow large enough during a specified year to qualify as saplings, poletimber, or sawtimber.

Inhibiting vegetation. Cover sufficiently dense to prevent the establishment of tree seedlings.

Land area. The area of dry land and land temporarily or partly covered by water such as marshes, swamps, and river floodplains (omitting tidal flats below mean high tide), streams, sloughs, estuaries, and canals less than one-eighth of a statute mile in width, and lakes, reservoirs, and ponds less than 40 acres in area.

Live trees. All trees 1.0 inch d.b.h. and larger which are not dead at the time of inventory.

Live-tree volume. Volume (cubic feet) of wood above the ground line in live trees 1.0 inch d.b.h. and larger. The volume in twigs and lateral limbs smaller than 0.5 inch in diameter at the point of occurrence on sapling-size trees is included but is excluded on poletimber and sawtimber-size trees.

Log grade. A classification of logs based on external characteristics as indicators of quality or value.

Logging residues. The unused merchantable portion of growing-stock trees cut or destroyed during logging operations.

Logging slash. The unmerchantable portion of growing-stock trees (including saplings) plus all cull trees 1.0 inch d.b.h. and larger cut or destroyed during logging operations and not used.

Manageable stand. Timberland at least 60 percent stocked with growing-stock trees that can be featured together under a management scheme.

Merchantable portion. That portion of live trees 5.0 inches d.b.h. and larger between a 1-foot stump and a minimum 4.0-inch top diameter outside bark on the central stem. That portion of primary forks from the point of occurrence to a minimum 4.0-inch top diameter outside bark is included.

Merchantable volume. Solid-wood volume in merchantable portion of live trees.

Miscellaneous Federal land. Federal land other than national forests, land administered by the Bureau of Land Management, and land administered by the Bureau of Indian Affairs.

Miscellaneous private land. (see: Other private land).

Mortality. The merchantable volume in trees that have died from natural causes during a specified period.

National forest land. Federal land that has been legally designated as national forests or purchase units, and other land under the administration of the Forest Service, including experimental areas and Bankhead-Jones Title III land.

Net annual growth. The net change in merchantable volume for a specific year in the absence of cutting (gross growth minus mortality for that specified year).

Net volume. Gross volume of wood less deductions for rot, sweep, or other defect affecting use for timber products.

Noncommercial species. Tree species of typically small size, poor form, or inferior quality which normally do not develop into trees suitable for industrial wood products.

Nonforest land. Land that has never supported forests and land formerly forested where timber production is precluded by development for other uses.

Nonindustrial private forest (NIPF) land. (see: Other private land).

Nonstocked forest land. Timberland less than 16.7 percent stocked with growing-stock trees.

Other private land. Privately owned land excluding forest industry land or forest industry-leased land. Also referred to as nonindustrial private forest (NIPF) land.

Farmer-owned land. Owned by farm operators, excluding incorporated farm ownerships.

Other individual land. Owned by individuals other than farm operators.

Other corporate land. Owned by corporations, including incorporated farm ownerships .

Other removals. The growing-stock volume of trees removed from the inventory by cultural operations such as timber stand improvement, land clearing, and other changes in land use that result in the removal of the trees from the timberland.

Plant residues. Wood material generated in the production of timber products at primary manufacturing plants.

Coarse residues. Material, such as slabs, edgings, trim, veneer cores and ends, which is suitable for chipping.

Fine residues. Material, such as sawdust, shavings, and veneer chippings, which is not suitable for chipping.

Plant byproducts. Residues (coarse or fine) utilized in the further manufacture of industrial products or for consumer use, or utilized as fuel.

Unused plant residues. Residues (coarse or fine) that are not used for any product, including fuel.

Poletimber-size trees. Live trees at least 5.0 inches d.b.h. but smaller than sawtimber size.

Productive-reserved forest land. (see: Reserved timberland).

Quality class. A classification of sawtimber volume by log or tree grades.

Rangeland. Land on which the natural vegetation is predominantly native grasses, grasslike plants, forbs, or shrubs valuable for forage, not qualifying as timberland and not developed for another land use. Rangeland includes natural grassland and savannah.

Reserved timberland. Forest land sufficiently productive to qualify as timberland, but withdrawn from timber utilization through statute or administrative designation.

Rotten trees. Live trees of commercial species that do not contain at least one 12-foot saw log, or two noncontiguous saw logs, each 8 feet or longer, now or prospectively, primarily because of rot or missing sections, and with less than one-third of the gross board-foot tree volume in sound material.

Rough trees. Live trees of commercial species that do not contain at least one 12-foot saw log, or two noncontiguous saw logs, each 8 feet or longer, now or prospectively, primarily because of roughness, poor form, splits, and cracks, and with less than one-third of the gross board-foot tree volume in sound material; and live trees of noncommercial species.

Roundwood (roundwood logs). Logs, bolts, or other round sections cut from trees for industrial or consumer uses.

Roundwood chipped. Any timber cut primarily for pulpwood, delivered to non-pulpmills, chipped, and then sold to pulpmills as residues, including chipped tops, jump sections, whole trees, and pulpwood sticks.

Roundwood products. Any primary product such as lumber, poles, pilings, pulp, or fuelwood which is produced from roundwood.

Salvable dead trees. Standing or down dead trees considered utilizable by Forest Inventory and Analysis standards.

Saplings. Live trees 1.0 to 5.0 inches d.b.h.

Saw log. A log meeting minimum standards of diameter, length, and defect, including logs at least 8 feet long, sound and straight, and with a minimum diameter inside bark for softwoods of 6 inches (8 inches for hardwoods).

Saw-log portion. That part of the bole of sawtimber trees between a 1-foot stump and the saw-log top, including the portion of forks large enough to contain a saw log.

Saw-log top. The point on the bole of sawtimber trees above which a conventional saw log cannot be produced. The minimum saw-log top is 7.0 inches in diameter outside bark (d.o.b.) for softwoods and 9.0 inches (d.o.b.) for hardwoods.

Sawtimber-size trees. Softwoods 9.0 inches d.b.h. and larger and hardwoods 11.0 inches d.b.h. and larger.

Sawtimber volume. Growing-stock volume in the saw-log portion of sawtimber-size trees in board feet (International 1/4-inch rule).

Seedlings. Live trees of commercial species less than 1.0 inch d.b.h. that are expected to survive and develop.

Site class. A classification of forest land in terms of inherent capacity to grow crops of industrial wood based on fully stocked natural stands, by annual production capacity.

Class 1. 165 or more cubic feet per acre.

Class 2. 120 to 164 cubic feet per acre.

Class 3. 85 to 119 cubic feet per acre.

Class 4. 50 to 84 cubic feet per acre.

Class 5. 20 to 49 cubic feet per acre.

Softwoods. Gymnosperm; in the order Coniferales, usually evergreen (includes the genus Taxodium which is deciduous), having needles or scalelike leaves.

Pines. Yellow pine species which include loblolly, longleaf, slash, pond, shortleaf, pitch, Virginia, sand, spruce, and Table Mountain pines.

Other softwoods. Cypress, eastern red-cedar, white cedar, eastern white pine, eastern hemlock, spruce, and fir.

Stand-size class. A classification of forest land based on the diameter class distribution of live trees in the stand.

Sawtimber stands. Stands at least 16.7 percent stocked with live trees, with half or more of total stocking in sawtimber and poletimber trees, and with sawtimber stocking at least equal to poletimber stocking.

Poletimber stands. Stands at least 16.7 percent stocked with live trees, of which half or more of total stocking is in poletimber and sawtimber trees, and with poletimber stocking exceeding that of sawtimber.

Sapling-seedling stands. Stands at least 16.7 percent stocked with live trees of which more than half of total stocking is saplings and seedlings.

State, county, and municipal land. Land owned by States, counties, and local public agencies or municipalities, or land leased to these governmental units for 50 years or more.

Stocking. The degree of occupancy of land by trees, measured by basal area or the number of trees in a stand and spacing in the stand, compared with a minimum standard, depending on tree size, required to fully utilize the growth potential of the land.

Fully stocked. 100 percent or more stocking.

Medium stocked. 60 to 99 percent stocking.

Poorly stocked. Less than 60 percent stocking.

Survivor growth. The merchantable volume increment on trees 5.0 inches d.b.h. and larger in the inventory at the beginning of the year and surviving to its end.

Timberland. Land at least 16.7 percent stocked by forest trees of any size, or formerly having had such tree cover, not currently developed for nonforest use, capable of producing 20 cubic feet of industrial wood per acre per year and not withdrawn from timber utilization by legislative action.

Timber products. Roundwood products and byproducts.

Timber removals. The merchantable volume of trees removed from the inventory by harvesting, cultural operations such as stand improvement, land clearing, or changes in land use.

Top. The portion of the main stem and forks from a 4.0-inch diameter outside bark to the tips of the main stem and forks, plus all other limbs above the 4.0-inch top at least 0.5 inch in diameter at their point of occurrence.

Treatment opportunity. A classification of the management or treatment that would most improve for timber production the existing condition of the stand being sampled.

Tree grade. A classification of sawtimber trees based on the log grade of the butt log in the tree.

Unproductive forest land. (see: Woodland) .

Upper-stem portion. That part of the main stem or fork of sawtimber trees above the saw-log top to minimum top diameter 4.0 inches outside bark or to the point where the main stem or fork breaks into limbs.

Urban and other areas. Areas developed for residential, industrial, or recreational purposes, school yards, cemeteries, roads, railroads, airports, beaches, powerlines and other rights-of-way, or other nonforest land not included in any other specified land use class.

Woodland. Forest land incapable of producing 20 cubic feet per acre per year of industrial wood under natural conditions, because of adverse site conditions.

Stocking Standard

D.b.h. class	Minimum number of trees per acre for full stocking	Minimum basal area per acre for full stocking
Seedlings	600	--
2	560	--
4	460	--
6	340	67
8	240	84
10	155	85
12	115	90
14	90	96
16	72	101
18	60	106
20	51	111

Conversion factors

Cubic feet of wood per average cord (excluding bark)

D.b.h. class	Al 1 species	Pine	Other softwood	Hardwood
6	60.6	61.0	68.2	6000
8	68.5	68.1	76.0	68.4
10	73.5	73.1	81.4	73.4
12	76.7	76.7	85.2	76.4
14	78.8	79.4	88.2	78.4
16	80.4	81.6	90.4	79.8
18	81.4	83.3	92.4	80.8
20	82.3	84.8	93.3	81.5
22	82.8	86.0	95.1	82.1
24+	83.9	87.7	97.8	83.0
Average	74.9	72.0	85.0	75.3

Metric equivalents of units used in this report

1 acre = 4,046.86 square meters or 0.404686 hectare
 1 cubic foot = 0.028317 cubic meter
 1 inch = 2.54 centimeters or 0.0254 meter
 Breast height (4.5 feet) = 1.4 meters above ground level
 1 square foot = 929.03 square centimeters or 0.0929 square meter
 1 square foot per acre basal area = 0.229568 square meter per hectare
 1 pound = 0.454 kilogram
 1 ton = 0.907 metric ton

County Tables

The county tables are intended for use in compiling forest resource estimates for groups of counties. Because the sampling procedure used by the Forest Survey was intended primarily to furnish inventory data for the survey unit as a whole, individual county estimates have limited and variable accuracy. As county totals are broken down by various subdivisions, the possibility of error increases and is greatest for the smallest items. The order of this increase can be computed with the formula on page 5.

Table 1--Area, by county and land class, Virginia, 1992

County	All land ^a	Forest land			Nonforest land ^b	
		Total	Timberland	Woodland		Reserved timberland
Acres						
Accomack	304,435	96,630	94,507	2,123	--	207,805

^aFor yellow pines, tree grade is based on "Southern Pine Tree Grades for Yard and Structural Lumber," Research Paper SE-40, published by the Southeastern Forest Experiment Station, Asheville, NC, 1968. Tree grade 4 does not apply to yellow pine.

^bFor other softwoods (excluding cypress), tree grade is based on "Tree Grades for Eastern White Pine," Research Paper NE-214, published by the Northeastern Forest Experiment Station, Radnor, PA, 1971.

^cFor hardwoods and cypress, tree grades 1, 2, and 3 are based on "Hardwood Tree Grades for Factory Lumber," Research Paper NE-333, published by the Northeastern Forest Experiment Station, Radnor, PA, 1976. Grade 4 trees are sawtimber trees not qualifying as tree grades 1, 2, or 3. The butt log of these trees qualify as construction (tie and timber) logs based on "A Guide to Hardwood Log Grading (revised)," General Technical Report NE-1, published by the Northeastern Forest Experiment Station, Radnor, PA, 1971.

*To provide a basis for valid comparisons, adjustments have been made to allow for differences in volume tables and sawtimber specifications used in previous surveys.

^bMerchantable volume.

Johnson, Tony G. 1992. Forest statistics for Virginia, 1992. Resour. Bull. SE-131. Asheville, NC: U.S. Department of Agriculture, Forest Service, Southeastern Forest Experiment Station. 66 pp.

Since 1986, area of timberland in Virginia declined by less than 1 percent. Nonindustrial private forest landowners control 77 percent of the State's timberland. Area classified as a pine type declined less than 1 percent to 3.4 million acres. More than 186,000 acres were harvested annually, while 201,000 acres were regenerated by artificial and natural means. Volumes of both softwood and hardwood growing stock increased by 6 percent. Net annual growth of softwoods increased by 39 percent, while hardwood growth decreased by 7 percent. Annual removals of softwood and hardwood growing stock rose 23 and 27 percent, respectively. Annual mortality of softwood growing stock dropped 24 percent to 55 million cubic feet, whereas hardwood mortality jumped 33 percent to 121 million cubic feet.

KEYWORDS: Timberland, forest ownership, timber volume, timber growth, timber removals, timber mortality.

Southeastern Forest Experiment Station

Established 1921

The Southeastern Forest Experiment Station, headquartered in Asheville, North Carolina, is one of the eight regional Experiment Stations, and the Forest Products Laboratory, that make up the Forest Service research organization.

RESEARCH MISSION:

To acquire the knowledge, develop the technology, and disseminate the research findings required to manage the Southeast's forest resources in ways that satisfy demands of goods and services while maintaining a quality environment.

RESEARCH LOCATIONS:

Blacksburg, VA
Research Triangle Park, NC
Franklin, NC
Clemson, SC
Charleston, SC
Athens, GA
Macon, GA
Olustee/Gainesville, FL

EXPERIMENTAL FORESTS:

Chipola, Marianna, FL
Holt Walton, Vienna, GA
Cowetta, Otto, NC
Bent Creek, Asheville, NC
Santee, Moncks Corner, SC
Scull Shoals, Athens, GA
Hitchiti, Juliette, GA
Olustee, Olustee, FL
